Locate events in Calendar 1

Locate events in Calendar

Hi there. Firstly I would like to say I have only just logged on as a new user. So far I am very impressed with what you have managed to do. I would be keen to do some gash usability testing if that would be useful.

I was looking at the calendar and noted that it was showing an event in Australia, which is fine and very interesting of course. I am sadly very parochial and only want to see events that are happening in London. So I looked at the filter and there doesn't seem to be a way to filter by location. Looking at the input page there isn't a separate entry facility for address/geo info at all.

Browsing the Drupal site, I see that some people have tried to customise the event module itself <http://drupal.org/node/34504> others have used flexinode to modify it. I can't find a single comprehensive description of what to do.

I am interested in your thoughts about this, whether it is already "on the to do list" etc.

Peter
